

Auth0 Transition

And how it benefits you

Cutting Edge Security

Auth0 is ISO27001 certified, has completed a full third-party SOC 2 Type II audit, and offers HIPAA Business Associate Agreements to customers handling PHI data. In the future, your account could also be configured with multifactor authentication. Your Auth0 password is never stored, or even read by .decimal software, effectively removing a possible attack vector.

Greater Control

Accounts set up with Auth0 can have managers, making it easy for your team to add users to your site, remove users from your site, configure the versions for your .decimal applications, and more at direct.dotdecimal.com.

Password Recovery

Auth0 provides a secure way to automatically reset your password, without needing to contact customer support.

Expandability

In the future, your .decimal account could be linked to your organization's credentials, meaning you wouldn't need to keep track of an extra password just for .decimal.
